Abstract: An experiment intended to probe possible effects of the future discernable in past artifacts resulted in the discovery a) that an artifact found prior to planning this experiment had a meaning in terms of unique data retrieved at the time of the experiment and b) unexpected results included locating “zographie” a concept of information organization similar to the contemporary “fluidice matrix” in use five centuries in the past. These results were obtained via a protocol of locating the past artifact in a private library strictly by touch. No photon-dependent electronic recording device was used in the experiment although a photo of the artifact is given as reference.

Key-Words: time, future, quantum, tensor, esp, telekinesis, topology, memory, death, fluidice

1 Introduction

The idea that topological memory can be regularly harnessed by a link between human intelligence and spirits, as was advanced in medieval scholarship, should be seriously investigated in light of current nano-technical advances in electronic and ceramic design which may facilitate topological patterning effects arbitrarily entering the realm of local causality. There exists, in potential, an information input from the present which intends to change certain known past events by going “outside linear time” to alter events in the past and/or future of the desired and/or regretted action. In this context, one may observe anomalous effects in the present either in the form of a perceived “haunting” or odd reactivity in a person “over-shadowed” by thoughts inducted by the topological patterning of reflexive time. Often such reflexive “time jumps” in behavior and ideation may be linked to concepts of genetic ancestry. Several theorists have convincingly argued for the existence of “morphogenetic fields.” These are topological energy fields which guide the development of DNA and gene structuring and may actually be able to interact field to field with the effect of introducing physical characteristics and/or innate behavior characteristics into the DNA by subtle rather than strictly evolutionary means. This evolutionary function of reflexive time can be represented in a “fluidice matrix” diagram if one takes the linear electromagnetic continuum to be the cellular generations of organic species generated sequentially by the developing genetic prototype.

Figure 1: Reflexive Time in Genetics
2 Problem Formulation

In the area of genetics there is a significant question about the “alternate futures” speculations generated by quantum physics theory. If we can create an alternate future by making a decision in the present, can a spirit intelligence or self-organizing event matrix be triggered by deliberate action in reflexive time into a patterning which literally changes the past from the present fulcrum and therefore changes the future? Might certain “hauntings” then be hindsight intentions rather than visitations from the historical past?

2.1 Directed Tachyons

Tachyons have been observed to seemingly “move backward in time”. So if one could “ride a tachyon” intelligently with directed intent one might be able to alter the shape of past events by altering a small part of past atomic/molecular configuration. If time is discussed as a series of snapshot-like frames, then the alteration of even a very small element in the still frame will create a new multidimensional destiny flow. An easily accessible analogy for this process is the insertion of one or several film frames or “photoshop instants” into an already existing scene. If the initial scene showed no ashtray, for example, and several frames are inserted showing an ashtray on a table, this may change the meaning of a subsequent dialogue about how no one in the group is smoking. In this example, the “ashtray clue” coming before the “no smoking” statement was inserted after the “no smoking” statement by an editing process which can topologically view the sequence of still frames.

A more advanced version of this process might be accomplished by taking the Turing machine model quite literally and employing the type of process used in practical remote viewing experiments to assist the traveling mind in conceptualizing events recorded through known sequential time, in the same way that maps are used in old-fashioned dowsing and remote viewing projects. In this procedure, the Remote Viewer places the active intelligence in the topological space “above” the Turing machine model and thus can view and select past and future events from the electromagnetic “recording strip” of sequential instants which include the present electromagnetic moment under the specific selector window of the Turing machine. Thus, the Remote Viewing Operator by a willed decision “edits in” a change in the presently viewed frame which will alter the past/future of the now-RV-edited destiny sequence.

2.2 Beyond Mathematical models

Conceivably such deliberate effects could be literally engineered and enhanced by a form of telekinesis combined with the use of nano-sensitive equipment. How, then, does one detect such an action and/or experimentally design and engineer such a test? How are such effects measured? If, for example, a Turing machine frame in the past was altered to change the present, then there would be no way of documenting from a new present frame the previous unaltered present situation. Do certain material artifacts of an altered destiny pattern still remain as small details? The only experiment which might possibly document such activity would be the alteration of a past event frame, already recorded and copied or “tallied” by an artifact, in order to change the future of present circumstances. The “tallied artifact” affected would of course have to be structurally non-dependent on the nano-reactions in the chemistry of film, cyber and digital sound/visual image recorders. But if this “destiny-editing” experiment was successful, would any artifacts from the previous destiny pattern or “alternate timeline” remain available in the altered, dominant destiny pattern? Here the “destiny editing” in question is not a simple telepathic sense of “mental contact causing healing or hexing” and which results in psychological and/or memory change but a literal, multidimensional “quasi-quantum
material shift” in the actual molecular structuring as well as any measurement of events. In tensor calculus, such a “configuration jump” can be indicated. But trying to figure out how dominant futures can be triggered and alternate futures traced is not possible in the present tensor calculus or other systems limited to linear and four dimensional formulations, even if a structural, atomic-molecular situation rather than the geometry of an X, Y, Z axis is considered. This is so because the “time alteration” on the Z axis in tensor calculus remains conceptually linear.

2.3 Non-local Operative Intelligence

A photograph of an artifact from the disputed past/present “now” might be retained in any altered future and the past event thus focused upon by a Remote Viewing operator. But here the practical function of such operative intelligence comes into the picture. The actual operation cannot be accomplished without a linking or templating with some type of intelligent logos which comprehends the templating request and can catalyze the self-alteration of the templated event. Images of the shaman riding the reflexive time capabilities of a multidimensional intelligence or spirit entity are depicted in all terrestrial cultures as a man or woman riding a dragon or linked to the stellar movements of a cosmic non-human dragon-serpent. It might be argued that this type of “concept matching” could be done by an advanced electronic mechanism somewhat like a cyber search engine or similar status-check and repair mechanism which compares templates with new information but the self-organizing capacities of such a “neo-Turing fetch & match machine” would have to be termed “living” because the possibility of inventing future-oriented options is left open. Dead agendas never change.

2.4 Organic Death and Living Agendas

A materially-organic body, when one living agenda has left it, begins to “decay” into the environment and thus becomes part of the bacterial living agenda, even when cremated. An aside from electronics here is that, using this simple paradigm, some form of “vampirism” might be possible if an intelligent living agenda begins to inhabit an organic system very shortly after the organic “death”, which is the detachment of the primary coordinating agenda from the electro-neural organic mechanism. Certain currently circulating examples of controversial and perhaps disinformative time travel experimentation narrate the adventures of an individual named AI Bielek who claims to be the survivor of an experiment which sent his operative intelligence back in time, thus causing traumatic effects when he sped back along his current lifetime time line past birth and conception into a past lifetime identity. This seems to be incorrect and confused since the viewing of molecular history from the non-local perspective would be a topological agenda and not any neural, organic agenda. Time travel of the operative intelligence as versus superluminal time travel of the molecular object and/or neurally-coordinated organism is a major conceptual problem. Perhaps Mr. Bielek was incorrectly instructed by a hypnotist or experimental monitor.

3 Problem Solution

An experiment directed toward the repeatable use of the type of time perception mechanisms described previously in this paper was conducted for the purpose of probing and perhaps verifying these concepts. An exact chronology of this experiment is not given in this printed paper for security reasons. During a remote viewing session under circumstances similar to circumstances which had in the past resulted in interesting information, a book was located on the shelf of a private library which contained a section of several pages paper clipped together. This book was located strictly by touch without prior reading of titles where it had been shelved for several years in a collection containing a wide range of topics. The book retrieved by touch was a biography of British Royal
Navigator Dr. John Dee which contained a paper clipped section describing various arcane mental disciplines of the 16th Century Elizabethan Era including “Zographie”. At first, the experimenter resisted this remote viewing result because it was not the type of “proof” expected. In fact, the written content of the paper-clipped section echoed another research project then being discussed by correspondence. The other project was a possible film or cable television show concerning the so-called Northern Isles off Canada which have a history of unexplained and austere effects upon those who have ventured to probe ancient sites there. The paper-clipped section retrieved for this experiment by blind RV happened to refer briefly to two unfortunate shipwrecks by Dr. John Dee’s emissary Sir Humphrey Gilbert which resulted in the loss of maps and documents recovered from this same area of Nova Scotia and Newfoundland at the end of the 16th Century. After reflection, it was decided that a result is not changeable in experimental context. One does not throw out a piece of information simply because it seems to be a spillover from another project. If it is a cross-reference, then the result is simply that RV retrieved a cross reference.

3.1 Cross References
The objective of the experimental remote viewing (RV) session was to locate an artifact which would demonstrate future effects on past activities, the interruption of non-sequential thought patterning into the expected flow of events. A cross-reference to 16th Century mystical navigation had not been expected. In fact, it was not welcome. Therefore, it might indicate the desired "interruption". As described in the paper clipped reference retrieved by RV touch, “Zographie” in Dr. Dee’s 16th Century lexicon means the projection of a mentally-perceived topology into material communications, specifically sketches and diagrams, so that a talismanic effect is achieved.14 This is quite similar in concept to the more technically-oriented “fluidic matrix” notations which this experimenter has been designing. However, these are concepts and diagrams and the purpose of the experiment was to retrieve evidence in the form of an artifact from the past discerned as having been affected by the future. There had been correspondence concerning the other, media project about possibilities of ancient and medieval sorcery connected with the exploration of the Northern Isles. In this context, an unexplained artifact had been found on the experimenter’s doorstep. This “find” resulted in instantaneous visionary information seeming to concern an individual of a certain, definite appearance. Thus, it was interpreted as an apport possibly generated by a spirit or discarnate intelligence.

It was simply a square-headed rusty nail. Later in the media-oriented correspondence, an article from a biographical source sent by a person unaware of the “rusty nail experience” included a sketch which matched the visionary RV impression associated with the rusty nail. The resemblance of the biographical illustration to the visionary impression was matched and verified by the correspondent, as well as the primary experimenter. If this verified cross-reference indicates that the “rusty nail experience” in the past was caused by the subsequent experimental attempt to find evidence of a future event affecting the past, then the situation is complex. For the experiment may now have caused some type of action in the spirit or “reflexive time” realms relative to a rivalry between adepts which actually began in the 12th Century.
3.2 Associative conflicts

One of the hazards of utilization of “reflexive time” and/or links with discarnate intelligences is this type of time dislocation or bi-location which may in some cases be related to the morphogenetic field of the DNA of participants as well as to past histories of disputed locations cryptically represented on ancient maps. A reasonable speculation in terms of this experiment is that the “reflexive time” effects have something to do both with “Zographie” and the maps lost in the 16th Century shipwrecks. For, in terms of the type of historical identity suggested by the “rusty nail interruption”, maps and arcane information on the Northern Idles may have belonged originally to Norman-Scots Lords familiar with Arabic sorcery and practices and not actually to the Navigator of the British Monarch Elizabeth I, who may have received these documents in context of the continual raids and re-raiding of the castles of the Scots Normans by supporters of the British throne. For the “rusty nail” interruption involves the description of the descendent of a Norman Lord boiled in lead as a sorcerer in 1330 approximately. What does this actually mean to us today? A feeble joke might be offered in response. To wit: coating the body of a sorcerer in molten lead does not thus encapsulate his soul, spirit or operative identity. Appropriately, the name of the Scots-Norman Lord brought into modern focus by the “rusty nail” interruption was William deSoulis, son of Nicholas deSoulis. The experimenter did not recall ever hearing of Lord deSoulis prior to these unsettling interruptions. But one speculates such a dedicated intelligence might also be able to interrupt the side of a 16th Century frigate with a hole made by a rusty nail and thus sink a ship which might have been bearing maps related to locations stolen or commandeered from the Norman-Scots succession.

It was found that a potential difficulty with utilization of RV topological time techniques was the departure from present focus into associative issues involved with the interruption of induced “reflexive time” operations into the ordinary process of sequential time. A complex “fluidice matrix” notation involving historical implications related to the upwelling of the deSoulis subplot into British / Scots history was drawn up and then discarded as aside from the central result of the experiment. This draft remains available as a result of the experiment, as do scrawled notes on the historical correspondences.

4 Conclusion.

Recollection of reactions and research surrounding the anomalous advent of an antiquated rusty nail onto the doorstep of the experimenter, an incident which preceded the experiment itself, served to change the way in which a paper clipped passage in a book experimentally chosen by blind remote viewing (“dowsing”) was ultimately interpreted. It is possible that the “rusty nail”, as object, was part of a zographical pattern deliberately enacted by the experimenter subsequent to this object’s otherwise unexplained appearance. What technical relevance does this exhibit? As an instance of “time insult” such an induced material apport could be used as a subtle weapon as well as an item of wonder. In fact, programming on the nano-level of reflexive time usage, as directed toward a sequence of events already known and recorded as to linear date of occurrence is a powerful tool for changing that sequence. But, unlike raw manipulation of nuclear devices by employees such as software engineers, the operator making the linkage with “reflexive time” must be able to transact non-sequential conceptual links mentally, in the sense of non-local remote viewing and telekinesis applications. Thus, until mental training in these skills is accepted, little progress in practical use of these operative systems will be made.
