

Special treatments such as CO₂ capture for the increasing of the heating value of the biogas, acid hydrolysis,

Biogas is a RES that should be added as application in different areas, especially for farmers and regional advantages. The benefits go not only to the environmental protection, but also they close the financial loop of the fuel costs that, in case of biogas is remaining in the local community, the same, that generates the input raw material for its production.

Acknowledgement:

The financial provided support of the EPOC (www.mec.upt.ro/epoc) and BIO-HEAT research projects, Post-Doc Research Grant, 4D-POSTDOC (www.cm.upt.ro) co-financed by EU program as well the support of the research team from UPT are notable and also gratefully acknowledged. Measurements have been accomplished with attested methods offered by the ISO CEN accredited laboratory, www.mediu.ro.
