Abstract: Our theory of determining a tensor by single-time flow energy is similar to those developed by Sharafutdinov. Section 1 refines the theory of potential curves determined by a flow and a Riemannian metric. Section 2 defines the boundary energy of a potential curve and proves that the problem of determining a metric from a single-time flow boundary energy cannot have a unique solution. Section 3 linearizes the above-mentioned problem and defines the notion of single-ray transform.

Key Words: potential curves, least squares Lagrangian, single-ray transform, boundary energy.

1 Potential curves

Let (M, g) be a compact Riemannian manifold with the boundary ∂M and of dimension n . We consider $x = (x^i)$ local coordinates on the manifold (M, g) , $(G_{jk,\ell})$ and (G_{jk}^i) its Christoffel symbols of the first and of the second type, respectively.

Let $\varphi: [0, 1] \rightarrow M$, $\varphi(t) = x$, $x(t) = (x^1(t), \dots, x^n(t))$ be a C^∞ -curve. We want to approximate the velocity $\frac{dx}{dt}$ of components $\frac{dx^i}{dt}$ by a C^∞ -distinguished vector field X of components $X^i(x)$, in the sense of least squares. For that we build the flow $\frac{dx^i}{dt}(t) = X^i(x(t))$, $\overline{1, n}$, $x(0) = p$, $x(1) = q$, where p and q are two points from the boundary ∂M of the manifold M , and the least squares Lagrangian (flow energy density),

$$L(t, x(t), \dot{x}(t)) = \frac{1}{2} g_{ij}(x(t)) [\dot{x}^i(t) - X^i(x(t))] [\dot{x}^j(t) - X^j(x(t))],$$

where $\dot{x}^i(t) = \frac{dx^i}{dt}(t)$.

The geometric dynamics (ODEs or PDEs) is a Lagrangian dynamics (ODEs or PDEs) determined by a least squares Lagrangian attached to a (single-time or multi-time) flow and a pair of Riemannian metrics, one in the source space and other in the target space.

Let us look for the Euler-Lagrange prolongation of the flow obtained as Euler-Lagrange ODEs produced by L . The extremals of L are called *potential curves*. These curves are geodesics [4].

Theorem 1.1 *The extremals of L are described by the ODEs:*

$$\frac{\delta}{dt} \dot{x}^i = g^{i\ell} g_{kj} (\nabla_\ell X^k) X^j + F_j^i \dot{x}^j, \quad i = \overline{1, n}$$

$$x(0) = p, \quad x(1) = q,$$

where:

$$\frac{\delta}{dt} \dot{x}^i = \ddot{x}^i + G_{jk}^i \dot{x}^j \dot{x}^k, \quad i = \overline{1, n},$$

$$F_j^i = \nabla_j X^i - g^{i\ell} g_{kj} \nabla_\ell X^k, \quad i, j = \overline{1, n}; \quad (1)$$

$$\nabla_j X^i = \frac{\partial X^i}{\partial x^j} + G_{jk}^i X^k, \quad i, j = \overline{1, n}. \quad (2)$$

Proof. We compute

$$\frac{\partial L}{\partial x^k} = \frac{1}{2} \frac{\partial g_{ij}}{\partial x^k} \dot{x}^i \dot{x}^j - \frac{\partial g_{ij}}{\partial x^k} \dot{x}^i X^j + \frac{1}{2} \frac{\partial g_{ij}}{\partial x^k} X^i X^j$$

$$- g_{ij} \dot{x}^j \frac{\partial X^i}{\partial x^k} + g_{ij} \frac{\partial X^i}{\partial x^k} X^j;$$

$$\frac{\partial L}{\partial \dot{x}^k} = g_{ik} \dot{x}^i - g_{ik} X^i;$$

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}^k} \right) = \frac{\partial g_{ik}}{\partial x^\ell} \dot{x}^\ell \dot{x}^i + g_{ik} \ddot{x}^i - \frac{\partial g_{ik}}{\partial x^\ell} \dot{x}^i X^\ell$$

$$- g_{ik} \left(\frac{\partial X^i}{\partial t} + \frac{\partial X^i}{\partial x^\ell} \dot{x}^\ell \right).$$

We take into account formula (1) and

$$\frac{\partial g_{ij}}{\partial x^k} = G_{ki}^\ell g_{\ell j} + G_{kj}^\ell g_{\ell i}, \quad i, j, k = \overline{1, n}.$$

If we replace these relations in Euler-Lagrange equations,

$$\frac{\partial L}{\partial x^k} - \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}^k} \right) = 0, \quad k = \overline{1, n},$$

we find

$$g_{kj} \frac{\delta \dot{x}^j}{dt} = g_{ij} (\nabla_k X^i) X^j + g_{kj} (\nabla_\ell X^j) \dot{x}^\ell - g_{ij} \dot{x}^i \nabla_k X^j, \quad k = \overline{1, n}.$$

Transvecting by $g^{\ell k}$ and using formula (2), we obtain

$$\frac{\delta \dot{x}^i}{dt} = g^{ik} g_{\ell j} (\nabla_k X^\ell) X^j + F_j^i \dot{x}^j, \quad i = \overline{1, n} \blacksquare$$

Definition 1.1 *The map $\varphi \in C^\infty([0, 1], M)$, $\varphi(t) = x$, which verifies the ODEs from the previous theorem is called potential curve associated to the d -vector field X .*

Definition 1.2 *The Riemannian metric g is called simple if there is a unique potential curve $x: [0, 1] \rightarrow M$, $x(0) = p$, $x(1) = q$, $p, q \in \partial M$.*

2 Determining a metric by boundary flow energy

Starting from the boundary flow energy, we study the recovering of a tensor from the centered moments which determine the metric g .

Let g be a simple metric and $x: [0, 1] \rightarrow M$ the corresponding potential curve, $x(0) = p$, $x(1) = q$, $p, q \in \partial M$.

Definition 2.1 *Let p and q be two points on the boundary ∂M of the manifold M . The function $E_g: \partial M \times \partial M \rightarrow \mathbb{R}$, $(p, q) \mapsto E_g(p, q)$,*

$$E_g(p, q) = \frac{1}{2} \int_0^1 g_{ij}(x(t)) [\dot{x}^i(t) - X^i(x(t))] [\dot{x}^j(t) - X^j(x(t))] dt$$

is called the boundary energy of the flow along the potential curve $x: [0, 1] \rightarrow M$, $x(0) = p$, $x(1) = q$, $p, q \in \partial M$.

Open problem 1. Given an energy E , is there a metric g that realizes this energy? How can these metrics be found?

Let us show that the existence problem of the metrics with the property that $E: \partial M \times \partial M \rightarrow \mathbb{R}$ represents the boundary energy cannot have a unique solution.

Let $\varphi: M \rightarrow M$ be a diffeomorphism with the property $\varphi|_{\partial M} = \text{id}$. This diffeomorphism transforms the simple metric g^0 into a simple metric $g^1 = \varphi^* g^0$, because we have

$$g^1(x)(\xi, \eta) = g^0((d_x \varphi)\xi, (d_x \varphi)\eta)_{\varphi(x)},$$

where $d_x \varphi: T_x M \rightarrow T_{\varphi(x)} M$ is the differential of φ .

It can be noticed that

$$X'^i = \frac{\partial x'^i}{\partial x^i} X^i,$$

where X'^i represents the distinguished vector field X with respect to $x' = \varphi(x)$.

The metrics g^0 and g^1 give different families of potential curves with the same boundary energy E .

Open problem 2. The problem of recovering a metric by boundary energy can be changed in the following way. Let g^0 and g^1 be simple metrics on M . Does the equality $E_{g^0} = E_{g^1}$ imply the existence of a diffeomorphism $\varphi: M \rightarrow M$, $\varphi|_{\partial M} = \text{id}$ and $g^1 = \varphi^* g^0$?

3 Linearization of the problem of finding a metric from the boundary energy

Let us linearize the open problem 1. Let (g^τ) be a family of simple metrics which depends smoothly on parameter $\tau \in (-\varepsilon, \varepsilon)$, $\varepsilon > 0$. Let p and q be two points of the border ∂M of the manifold M and $a = E(p, q)$, where $E: \partial M \times \partial M \rightarrow \mathbb{R}$ is the given boundary energy. Consider $x^\tau: [0, a] \rightarrow M$ the potential curve corresponding to the pair (p, q) , $x' = (x^{\tau, i})$, $x^{\tau, i}(t) = x^i(t, \tau)$, $i = \overline{1, n}$. We denote $g^\tau = (g_{ij}^\tau)$.

The energy of deformation x^τ is

$$E_{g^\tau}(p, q) = \frac{1}{2} \int_0^a g_{ij}^\tau(x^\tau(t)) [\dot{x}^i(t, \tau) - X^i(x(t, \tau), \tau)] [\dot{x}^j(t, \tau) - X^j(x(t, \tau), \tau)] dt.$$

Differentiating with respect to τ we obtain

$$\begin{aligned} \frac{\partial}{\partial \tau} E_{g^\tau}(p, q) &= \int_0^a \left\{ \frac{\partial g_{ij}^\tau}{\partial \tau}(x^\tau(t)) [\dot{x}^i(t, \tau) - X^i(x^\tau(t), \tau)] \right. \\ &\quad [\dot{x}^j(t, \tau) - X^j(x^\tau(t), \tau) + \frac{\partial g_{ij}^\tau}{\partial x^k}(x^\tau(t)) \left[\frac{1}{2} \dot{x}^i(t, \tau) \dot{x}^j(t, \tau) \right. \\ &\quad \left. - \dot{x}^i(t, \tau) X^j(x^\tau(t), \tau) + \frac{1}{2} X^i(x^\tau(t), \tau) \right. \\ &\quad \left. \left. X^j(x^\tau(t), \tau) \right] \frac{\partial x^k}{\partial \tau}(t, \tau) + g_{ij}^\tau(x^\tau(t)) \left[\frac{\partial \dot{x}^i}{\partial \tau}(t, \tau) \dot{x}^j(t, \tau) \right. \right. \\ &\quad \left. \left. - \frac{\partial \dot{x}^i}{\partial \tau}(t, \tau) X^j(x^\tau(t), \tau) - \dot{x}^i(t, \tau) \frac{\partial X^j}{\partial \tau}(x^\tau(t), \tau) \right. \right. \\ &\quad \left. \left. - \dot{x}^i(t, \tau) \frac{\partial X^j}{\partial x^k}(x^\tau(t), \tau) \frac{\partial x^k}{\partial \tau}(t, \tau) + X^i(x^\tau(t), \tau) \right. \right. \\ &\quad \left. \left. \frac{\partial X^j}{\partial \tau}(x^\tau(t), \tau) + X^i(x^\tau(t), \tau) \frac{\partial X^j}{\partial x^k}(x^\tau(t), \tau) \right. \right. \\ &\quad \left. \left. \frac{\partial x^k}{\partial \tau}(t, \tau) \right] \right\} dt = \int_0^a \frac{\partial g_{ij}^\tau}{\partial \tau}(x(t, \tau)) \left[\dot{x}^i(t, \tau) \dot{x}^j(t, \tau) \right. \\ &\quad \left. - 2\dot{x}^i(t, \tau) X^j(x^\tau(t), \tau) + X^i(x^\tau(t), \tau) X^j(x^\tau(t), \tau) \right] dt \\ &\quad + \int_0^a \left\{ \frac{\partial g_{ij}^\tau}{\partial x^k}(x^\tau(t)) \left[\frac{1}{2} \dot{x}^i(t, \tau) \dot{x}^j(t, \tau) \right. \right. \\ &\quad \left. \left. - \dot{x}^i(t, \tau) X^j(x^\tau(t), \tau) + \frac{1}{2} X^i(x^\tau(t), \tau) X^j(x^\tau(t), \tau) \right] \right. \\ &\quad \left. - g_{ij}^\tau(x^\tau(t)) [\dot{x}^i(t, \tau) - X^i(x^\tau(t), \tau)] \right. \\ &\quad \left. \frac{\partial X^j}{\partial x^k}(x^\tau(t), \tau) \right\} \frac{\partial x^k}{\partial \tau}(t, \tau) dt + \int_0^a g_{ij}^\tau(x^\tau(t)) [\dot{x}^j(t, \tau) \\ &\quad - X^j(x^\tau(t), \tau)] \frac{\partial \dot{x}^i}{\partial \tau}(t, \tau) dt - \int_0^a g_{ij}^\tau(x^\tau(t)) [\dot{x}^i(t, \tau) \\ &\quad - X^i(x^\tau(t), \tau)] \frac{\partial X^j}{\partial x^k}(x^\tau(t), \tau) \left\} \frac{\partial x^k}{\partial \tau}(t, \tau) dt + \int_0^a g_{ij}^\tau(x^\tau(t)) \right. \\ &\quad \left. [\dot{x}^i(t, \tau) - X^i(x^\tau(t), \tau)] \frac{\partial X^j}{\partial \tau}(x^\tau(t), \tau) dt. \right. \end{aligned} \quad (3)$$

Integrating by parts, then considering $\tau = 0$ and using the fact that

$$\frac{\partial x^i}{\partial \tau} \Big|_0^a = 0,$$

the third integral from relation (3) becomes

$$\begin{aligned} I_3 &= - \int_0^a \frac{d}{dt} \Big|_{\tau=0} g_{ij}^\tau(x^\tau(t)) [\dot{x}^j(t, \tau) - X^j(x^\tau(t), \tau)] \frac{\partial x^i}{\partial \tau}(t, 0) dt \\ &= - \int_0^a \left\{ \frac{\partial g_{ij}^0}{\partial x^\ell}(x^0(t)) \dot{x}^\ell(t, 0) [\dot{x}^j(t, 0) - X^j(x^0(t), 0)] \right. \\ &\quad \left. + g_{ij}^0(x^0(t)) \left[\ddot{x}^j(t, 0) - \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \dot{x}^\ell(t, 0) \right] \right\} \frac{\partial x^i}{\partial \tau}(t, 0) dt. \end{aligned}$$

Relation (3) becomes, at $\tau = 0$:

$$\begin{aligned} \frac{\partial}{\partial \tau} \Big|_{\tau=0} E_{g^\tau}(p, q) &= \int_0^a f_{ij}(x^0(t)) [\dot{x}^i(t, 0) x^j(t, 0) \\ &\quad - 2\dot{x}^i(t, 0) X^j(x^0(t), 0) + X^i(x^0(t), 0) X^j(x^0(t), 0)] dt \\ &\quad + \int_0^a \left\{ \frac{\partial g_{ij}^0}{\partial x^k}(x^0(t)) \left[\frac{1}{2} \dot{x}^i(t, 0) \dot{x}^j(t, 0) \right. \right. \\ &\quad \left. \left. - \dot{x}^i(t, 0) X^j(x^0(t), 0) + \frac{1}{2} X^i(x^0(t), 0) X^j(x^0(t), 0) \right] \right. \\ &\quad \left. - g_{ij}^0(x^0(t)) [\dot{x}^i(t, 0) - X^i(x^0(t), 0)] \frac{\partial X^j}{\partial x^k}(x^0(t), 0) \right\} \\ &\quad \frac{\partial x^k}{\partial \tau}(t, 0) dt + \left\{ - \int_0^a \frac{\partial g_{ij}^0}{\partial x^\ell}(x^0(t)) \dot{x}^\ell(t, 0) [\dot{x}^j(t, 0) \right. \\ &\quad \left. - X^j(x^0(t), 0)] + g_{ij}^0(x^0(t)) \left[\ddot{x}^j(t, 0) - \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \right. \right. \\ &\quad \left. \left. \dot{x}^\ell(t, 0) \right] \frac{\partial x^i}{\partial \tau}(t, 0) dt \right\} - \int_0^a g_{ij}^0(x^0(t)) [\dot{x}^i(t, 0) \\ &\quad - X^i(x^0(t), 0)] \frac{\partial X^j}{\partial \tau}(x^0(t), 0) dt, \end{aligned} \quad (4)$$

where $f_{ij} = \frac{1}{2} \frac{\partial}{\partial \tau} \Big|_{\tau=0} g_{ij}^\tau$.

Making the sum of the second and third integrals of (4), we obtain

$$\begin{aligned} I_2 + I_3 &= -2 \frac{\partial g_{kj}^0}{\partial x^i}(x^0(t)) \dot{x}^i(t, 0) \dot{x}^j(t, 0) + \frac{\partial g_{ij}^0}{\partial x^k}(t, 0) \\ &\quad [-2\dot{x}^i(t, 0) X^j(x^0(t), 0) + X^i(x^0(t), 0) X^j(x^0(t), 0)] \\ &\quad - 2g_{ij}^0(x^0(t)) \left[\dot{x}^i(t, 0) \frac{\partial X^j}{\partial x^k}(x^0(t), 0) - \frac{\partial X^i}{\partial x^k}(x^0(t), 0) \right. \\ &\quad \left. X^j(x^0(t), 0) \right] + 2 \frac{\partial g_{kj}^0}{\partial x^\ell}(x^0(t)) \dot{x}^\ell(t, 0) X^j(x^0(t), 0) \\ &\quad - 2g_{kj}^0(x^0(t)) \left[\ddot{x}^j(t, 0) - \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \dot{x}^\ell(t, 0) \right] \frac{\partial x^k}{\partial \tau}(t, 0) dt \\ &= \frac{1}{2} \int_0^a \left\{ -2g_{\ell k}^0(x^0(t)) G_{ij}^\ell(x^0(t), 0) \dot{x}^i(t, 0) \dot{x}^j(t, 0) \right. \\ &\quad \left. + [G_{kij}^0(x^0(t), 0) + G_{kji}^0(x^0(t), 0)] [-2\dot{x}^i(t, 0) X^j(x^0(t), 0) \right. \\ &\quad \left. + X^i(x^0(t), 0) X^j(x^0(t), 0)] - 2g_{ij}^0(x^0(t)) \right. \\ &\quad \left. \left[\dot{x}^i(t, 0) \frac{\partial X^j}{\partial x^k}(x^0(t), 0) - \frac{\partial X^i}{\partial x^k}(x^0(t), 0) X^j(x^0(t), 0) \right] \right. \\ &\quad \left. + 2[G_{k\ell j}^0(x^0(t), 0) + G_{\ell j k}^0(x^0(t), 0)] \dot{x}^\ell(t, 0) X^j(x^0(t), 0) \right. \\ &\quad \left. - 2g_{kj}^0(x^0(t)) \left[\ddot{x}^j(t, 0) - \frac{\partial X^j}{\partial t}(x^0(t), 0) - \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \right] \right\} \frac{\partial x^k}{\partial \tau}(t, 0) dt \end{aligned}$$

$$\begin{aligned}
 & \dot{x}^\ell(t, 0) \Big] \Big\} \frac{\partial x^k}{\partial \tau}(t, 0) dt = \frac{1}{2} \int_0^a \left\{ -2g_{\ell k}^0(x^0(t), 0) G_{ij}^\ell(x^0(t), 0) \right. \\
 & \dot{x}^i(t, 0) \dot{x}^j(t, 0) - 2g_{iq}^0(x^0(t), 0) \dot{x}^i(t, 0) \nabla_k X^q(x^0(t), 0) \\
 & + 2g_{jq}^0(x^0(t), 0) \left[G_{k\ell}^q(x^0(t), 0) X^\ell(x^0(t), 0) X^j(x^0(t), 0) \right. \\
 & \left. + \frac{\partial X^q}{\partial x^k}(x^0(t), 0) X^j(x^0(t), 0) \right] + 2g_{qk}^0(x^0(t)) \\
 & G_{j\ell}^q(x^0(t), 0) \dot{x}^\ell X^j(x^0(t), 0) + 2g_{kj}^0(x^0(t)) \\
 & \left. \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \dot{x}^\ell(t, 0) \right\} \frac{\partial x^k}{\partial \tau}(t, 0) dt \\
 & = \int_0^a \left\{ -g_{jk}^0(x^0(t)) [\dot{x}^j(t, 0) - g_{iq}^0(x^0(t)) \right. \\
 & \dot{x}^i(t, 0) \nabla_k X^q(x^0(t), 0) + g_{qk}^0(x^0(t)) G_{j\ell}^q(x^0(t), 0) \\
 & \dot{x}^\ell(t, 0) X^j(x^0(t), 0) + g_{kj}^0(x^0(t)) \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \\
 & \left. \dot{x}^\ell(t, 0) \right\} \frac{\partial x^k}{\partial \tau}(t, 0) dt = \int_0^a \left[-g_{\ell j}^0(x^0(t)) \right. \\
 & (\nabla_k X^\ell(x^0(t), 0) X^j(x^0(t), 0) - g_{ki}^0(x^0(t)) F_j^i(x^0(t), 0) \\
 & \dot{x}^j(t, 0) - g_{iq}^0(x^0(t)) \dot{x}^i(t, 0) \nabla_k X^q(x^0(t), 0) \\
 & + g_{jq}^0(x^0(t)) \nabla_k X^q(x^0(t), 0) X^j(x^0(t), 0) \\
 & + g_{qk}^0(x^0(t)) G_{j\ell}^q(x^0(t), 0) \dot{x}^\ell(t, 0) \\
 & \left. X^j(x^0(t), 0) \right] \frac{\partial x^k}{\partial \tau}(t, 0) dt = \int_0^a \left[-g_{ki}^0(x^0(t)) \right. \\
 & F_j^i(x^0(t), 0) \dot{x}^j(t, 0) - g_{iq}^0(x^0(t)) \dot{x}^i(t, 0) \\
 & (\nabla_k X^q)(x^0(t), 0) + g_{qk}^0(x^0(t)) G_{j\ell}^q(x^0(t), 0) \dot{x}^\ell(t, 0) \\
 & \left. X^j(x^0(t), 0) + g_{kj}^0(x^0(t)) \frac{\partial X^j}{\partial x^\ell}(x^0(t), 0) \right. \\
 & \left. \dot{x}^\ell(t, 0) \right] \frac{\partial x^k}{\partial \tau}(t, 0) dt = \int_0^a \dot{x}^j(t, 0) \left\{ -g_{ki}^0(x^0(t)) \right. \\
 & [(\nabla_j X^i)(x^0(t), 0) - g_{iq}^0(x^0(t)) g_{\ell j}^0(x^0(t)) \\
 & (\nabla_q X^\ell(x^0(t), 0))] - g_{jq}^0(x^0(t)) (\nabla_k X^q)(x^0(t), 0) \\
 & + g_{qk}^0(x^0(t)) G_{\ell j}^q(x^0(t), 0) X^\ell(x^0(t), 0) \\
 & \left. + g_{k\ell}^0(x^0(t)) \frac{\partial X^\ell}{\partial x^j}(x^0(t), 0) \right\} \frac{\partial x^k}{\partial \tau}(t, 0) dt \\
 & = \int_0^a \dot{x}^j(t, 0) \left[-g_{ki}^0(x^0(t)) (\nabla_j X^i)(x^0(t), 0) \right. \\
 & + g_{\ell j}^0(x^0(t)) (\nabla_k X^\ell)(x^0(t), 0) - g_{jq}^0(x^0(t)) \\
 & (\nabla_k X^q)(x^0(t), 0) + g_{qk}^0(x^0(t)) G_{\ell j}^q(x^0(t), 0) X^\ell(x^0(t), 0) \\
 & \left. + g_{k\ell}^0(x^0(t)) \frac{\partial X^\ell}{\partial x^j}(x^0(t), 0) \right] \frac{\partial x^k}{\partial \tau}(t, 0) dt = 0.
 \end{aligned}$$

We have obtained that

$$\begin{aligned}
 \frac{\partial}{\partial \tau} \Big|_{\tau=0} E_{g^\tau}(p, q) &= \int_0^a f_{ij}(x^0(t)) [\dot{x}^i(t, 0) - X^i(x^0(t), 0)] \\
 & [\dot{x}^j(t, 0) (-X^j(x^0(t), 0))] dt - \int_0^a g_{ij}^0(x^0(t)) [\dot{x}^i(t, 0) \\
 & - X^i(x^0(t), 0)] \frac{\partial X^j}{\partial \tau}(x^0(t), 0) dt,
 \end{aligned}$$

where $f_{ij}(x^0(t)) = \frac{1}{2} \frac{\partial}{\partial \tau} \Big|_{\tau=0} g_{ij}^\tau$.

Considering that $\frac{\partial X^j}{\partial \tau}(x^0(t), 0) = 0$, and using the functional

$$\begin{aligned}
 I_f(x^0) &= \int_0^a f_{ij}(x^0(t)) [\dot{x}^i(t, 0) - X^i(x^0(t), 0)] \\
 & [\dot{x}^j(t, 0) - X^j(x^0(t), 0)] dt
 \end{aligned}$$

the previous relation becomes

$$\frac{\partial}{\partial \tau} \Big|_{\tau=0} E_{g^\tau}(p, q) = I_f(x^0), \tag{5}$$

where x^0 is the potential curve corresponding to the points p, q from the border ∂M of the manifold M .

The function I_f is called *the single-ray transform of the tensor field* (f_{ij}).

The existence of solutions of the open problem 1 for the family (g^τ) implies the existence of a one parameter group of diffeomorphisms $\varphi^\tau(x)$ such that $g^\tau = (\varphi^\tau)^* g^0$. Explicitly

$$g_{ij}^\tau = (g_{k\ell}^0 \circ \varphi^\tau) \frac{\partial x'^k}{\partial x^i} \frac{\partial x'^\ell}{\partial x^j}, \tag{6}$$

where $\varphi^\tau(x) = (\varphi^1(x, \tau), \dots, \varphi^n(x, \tau))$, $x' = \varphi^\tau(x)$.

Theorem 3.1 *Let $v^k(x) = \frac{\partial}{\partial \tau} \Big|_{\tau=0} (x'^k)(x, \tau)$, $k = \overline{1, n}$, $v_i = g_{ij}^0 v^j$ and $v_{i;j}$ be the covariant derivative of (v_i). Then the following relation holds*

$$f_{ij} = \frac{1}{2} (v_{i;j} + v_{j;i}), \quad i, j = \overline{1, n}. \tag{7}$$

Proof. Differentiating the relation (6) with respect to τ and then considering $\tau = 0$, we find

$$\begin{aligned}
 2f_{ij} &= \frac{\partial}{\partial \tau} \Big|_{\tau=0} g_{ij}^\tau = \frac{\partial g_{k\ell}^0 v^m}{\partial x^m} \frac{\partial x'^k}{\partial x^i} \frac{\partial x'^\ell}{\partial x^j} \\
 &+ g_{k\ell}^0 \frac{\partial}{\partial x^i} \left(\frac{\partial}{\partial \tau} \Big|_{\tau=0} x'^k \right) \frac{\partial x'^\ell}{\partial x^j}
 \end{aligned}$$

$$\begin{aligned}
 &+g_{k\ell}^0 \frac{\partial x^{k\ell}}{\partial x^i} \frac{\partial}{\partial x^j} \left(\frac{\partial}{\partial \tau} \Big|_{\tau=0} x^{\ell} \right) \\
 &= \frac{\partial g_{k\ell}^0}{\partial x^m} v^m \delta_i^k \delta_j^\ell + g_{k\ell}^0 \frac{\partial v^k}{\partial x^i} \delta_j^\ell + g_{k\ell}^0 \delta_i^k \frac{\partial v^\ell}{\partial x^j} \\
 &= \frac{\partial g_{ij}^0}{\partial x^q} v^q + g_{jq}^0 \frac{\partial v^q}{\partial x^i} + g_{iq}^0 \frac{\partial v^q}{\partial x^j}.
 \end{aligned}$$

On the other hand,

$$\begin{aligned}
 v_{i;j} + v_{j;i} &= \frac{\partial v^i}{\partial x^j} - G_{ij}^m v_m + \frac{\partial v_j}{\partial x^i} - G_{ji}^m v_m = \frac{\partial g_{im}^0}{\partial x^j} v^m \\
 &+ g_{im}^0 \frac{\partial v^m}{\partial x^j} + \frac{\partial g_{jm}^0}{\partial x^i} v_m + g_{jm}^0 \frac{\partial v^m}{\partial x^i} \\
 &- g_0^{mq} \left(\frac{\partial g_{jq}^0}{\partial x^i} + \frac{\partial g_{iq}^0}{\partial x^j} - \frac{\partial g_{ij}^0}{\partial x^q} \right) g_{ms}^0 v^s \\
 &= \frac{\partial g_{ij}^0}{\partial x^q} v^q + g_{jq}^0 \frac{\partial v^q}{\partial x^i} + g_{iq}^0 \frac{\partial v^q}{\partial x^j},
 \end{aligned}$$

and relation (7) is proved ■

Therefore, the following generalization of the open problem 1 appears. To what extent do the integrals

$$\begin{aligned}
 I_f(x) &= \int_0^a f_{ij}(x(t)) [\dot{x}^i(t) - X^i(x(t))] \\
 &[\dot{x}^j(t) - X^j(x(t))] dt
 \end{aligned}$$

determine the tensor (f_{ij}) ?
